

An automobile accident injury AFTER COMPLETION OF  
ABC™ CARE!

\*\*\*\*\*

ONE OF THE MANY benefits you'll get from receiving the ABC™ method of body correction is that when you are finished with your regular visits, it becomes MUCH HARDER to mess your body up again.

This story gives you an idea of just how resilient the body becomes when it functions properly.

A 20 year old patient had completed our recommended program of care and was released from regular visits. About a month later, she was in an auto accident. She was going 55 mph on a 2-lane highway when she lost control of her car. She swerved left and then overcorrected back to the right. She then went over the edge of the road and down an embankment about 20 feet.

The front end of the care hit at the bottom of the hill and then the car flipped, END OVER END, and landed upside down, crushed from above. She was cut loose from her harness by people that came to help. She wasn't bleeding anywhere and, other than being shook up, didn't feel too bad.

I treated her later that day. Then three more times TOTAL before she was able to be released from regular care.

Had her body NOT been fixed already then any new injuries would have been ADDED ONTO an already "messed up" body. It could easily have taken a year or more to undo all of these new injuries.

The way she tells it is that the worst thing that happened to her was that she broke a couple of fingernails.
